Modular HVAC Systems

Performance Testing

Guaranteed Performance

Our broad range of performance testing is certifiable to NIST, including flow, pressure and electrical metering. Testing in a manufacturing environment is ideal because it guarantees performance of the system upon installation, eliminating most problems found during start-up and commissioning.

Our flow test stand can test up to 30,000 GPM, ensuring every Systecon system is tested to full design flow - something that field built systems can't always accommodate.

The factory test also includes testing of the control sequences - pump staging, chiller staging, valve operation, failure modes, etc.

Ultimate Plug-and-Play

Guaranteed performance means we find and fix any issues with your new modular system before it's delivered to your site, which makes installation fast and simple. Our performance testing is a requirement for all systems regardless of size or application.

When field-built systems have problems during start-up and commissioning, the solution may be unknown and untimely to identify. With Systecon, each and every component is validated so that your package meets the predicted performance before it ships out.

See Our Process

Along with testing, we offer a factory walkthrough to further ensure your expectations are met upon project completion. Systecon's priority is to ensure the owner and consulting engineer retain control over design and implementation, and that our solution is tailored to fit your needs.
